

Additional output for UVR1611

The universal controller UVR1611 can be upgraded with the HiRel1611. This allows an expansion from 11 to 13 outputs. For this purpose, sliding grooves are intended on the left side of the controller's console (designated as slot 1 in the controller's mounting instructions).

The relay contacts are potential-free, while both roots are connected ex works. By widening the hole between the two relays to at least 6 mm in diameter, the potential for both outputs is separated against each other in accordance with industry standards.

- L.....Common phase, without opened borehole
- L.....Root for opened borehole
- W.....Root
- S.....Closer NO
- O.....Opener NC

Max. switching capacity: 230V/3A
