Please read before commissioning!

This booklet explains the basic operation of the UVR67 controller. More detailed information on operation, programs and installation can be found in the enclosed booklets or on www.ta.co.at.

Basic operation

The display (1) on the front shows information about sensor values, menu position, parameterisation, etc.

The bar (2) on the right of the display moves along with the vertical position in the currently open menu. (Scroll bar)

The dial (3) to the right of the display is used for navigation. A clockwise rotation moves you down the menu; anti-clockwise moves you up.

Pressing the dial (3) opens the selected menu/allows you to change the selected value/parameter. (= Enter button)

Pressing the button (4) to the left of the dial exits a menu. (= Back button)

Pressing "Enter" (3) or "Back" (4) relates to the value/menu item with a border around it on the display.
User levels and password entry

The majority of all setting options are password-protected to prevent unauthorised persons from operating the controller. There are three user levels:

- **User**
  - Can change time and date information, and otherwise only view values.
- **Technician**
  - Additional access to the technician level, where e.g. parameters and manual mode of the outputs can be changed.
- **Expert**
  - Access to all setting options on the controller.

The expert password is therefore required to be able to operate the controller fully. It is factory set to **64**.

**Example: Password entry for expert access and program selection**

Turn the dial clockwise until there is a border around the entry **User** in the main menu. To confirm, press the dial (= Enter key).

The active user is always shown in bold in this menu. In the illustration this is the **User**. Turn the dial clockwise until there is a border around **Expert**. Press the dial to confirm.

The password query for expert access appears. Enter the password digit by digit. To do so, press the dial, which opens a column for selecting the first digit.

Turn the dial clockwise to scroll down until the required number is highlighted. In the example, the default password for expert access is entered, **64**. You therefore scroll to the first digit **6** and confirm by pressing the dial.

The first digit has been entered. To enter the second digit, turn the dial one notch clockwise. The arrow moves to the blank space next to the digit you have already entered.
Press the dial to open the entry again and select 4. Press the dial to confirm.

Once the full password has been entered, the entire entry still needs to be confirmed. Turn the dial clockwise until there is a bold border around the tick. Then press the dial.

In the example, the Expert is now shown in bold; there is now expert access to the controller. If the expert is not shown in bold, the password was not entered successfully. The expert password may have been changed by another user.

The settings that can now be made with expert access are in a different menu. Press Back to return to the main menu. From there, navigate to the item Settings (turn the dial anti-clockwise to navigate upwards in the menu).
Press the dial to open the menu.

The items Technician level and Expert level are now available. 
Technician level contains settings such as parameters (temperature thresholds, etc.), time programs and datalogging.
Expert level contains the program selection, settings for inputs and outputs, and other fundamental points.

Go to the program selection: Turn the dial clockwise until there is a border around Expert level. Press the dial to open the expert level.

This menu contains a large number of settings. In our example, the program is to be changed, so the menu Programming settings is opened.
In this menu you need to look out for the bold border again. In the example there is a border around Program. The number 0 below it is the set value.

If the program is to be changed, press the dial in the usual way while the bold border is shown around "Program".

The display 0-999 is the setting range. The number below this (with a red border) is the current value.

If the dial is turned clockwise, the program number is increased by one with each notch. Turn anti-clockwise to decrease the number.

Once the required number has been reached, confirm by pressing the dial.

Press Back to cancel the entry.

The program has been set successfully.

After setting the program, the Parameters at the Technician level need to be adapted according to the selected program and the local conditions.

When making any settings and carrying out any installation work, please observe the other enclosed instructions, especially the safety instructions they contain.
